

LYME COMMON ZONING DISTRICT BUILDOUT ANALYSIS
Based on 2019 Zoning Regulations

Conclusions:

A maximum build out of residences in the Lyme Common Zoning District (LCZD) under current zoning could add a substantial number of units to the area. Approximately 79 residential units could be added to the District if it were to be developed to its maximum capacity. Of these 79 added units, 49 (62%) would be conversions of existing structures to multi-dwelling units or internal accessory dwelling units. The other 30 added units would be newly constructed, external buildings. Currently, the LCZD has roughly 100 residential units on 130 properties.

Purpose:

The LCZD encompassing all of the Lyme Village is the heart of Lyme and is its most vibrant and densely populated area. It provides a pleasant mix of institutional, governmental, residential and business uses. In order to responsibly plan for Lyme's future, it is necessary to understand both the possibilities for and limitations of development there. In face of a regional shortage of housing the Planning Board focused exclusively on residential development potential.

Process:

The Planning Board contracted with the Upper Valley Lake Sunapee Regional Planning Commission to estimate the maximum build out for the LCZD. The results were somewhat helpful, but the criteria used caused the estimates to be far too high due to unrealistic assumptions and a lack of familiarity with the area and its properties. The Planning & Zoning Administrator and the Planning Board established more realistic criteria using estimates of gallons per day for septic disposal, overall area, maximum lot coverage, current lot coverage and road frontage.

All data values for the criteria (gallons per day for septic disposal, overall area, maximum lot coverage, current lot coverage and road frontage) were categorized into five classes using a Jenks Natural Breaks Classification system then assigned a rating of 1-5 based on the classification. For each lot, the ratings for the criteria were averaged to give the lot an overall rating. The higher the rating the more developable the lot.

The Planning Board reviewed each lot with a rating of 3 and higher. Using local knowledge and the data for each lot, the Board made a determination of how many dwelling units could be added to each lot. Dwelling units were identified as new units and conversions within existing buildings.

Lots where the Board believed that the current use would not change to a residential use were excluded from the analysis. These lots include the Congregational Church, both cemeteries, the horse sheds, the elementary school, the library, Consolidated Communication's switch building, and lots owned by the State and the Town.

Lot septic loading was calculated by using soil type information and average slope from the USDA-NRCS soils survey for Grafton County to determine a sewage loading factor¹. The area (in square feet) of each soil type within a lot multiplied by the loading factor, the result was then multiplied by 2000 (the sewage loading for an acre). The loading values for each soil type within a lot were added together to determine the total loading for the lot.

Loading factors are assigned based on two criteria, soil group (Appendix A) and slope. Because there is no direct correlation between the soil groups defined by NH DES and the USDA-NRCS soil data, a determination was made based on the soil description from the USDA-NRCS soils survey to assign a soil group to the USDA-NRCS soil types.

Soil slope was determined from the USDA-NRCS data. The USDA-NRCS data provided a range of slopes for the individual soil types. The average of the range was used as the slope value. Several adjustments made to the soil total area, first the maximum allowed lot coverage was deducted from the soils area, to remove the buildable area of the lot from the lot loading calculation. The second adjustment was to remove soils from within 10 feet of the property line where septic systems cannot be located. The third adjustment was to account for the NHDES requirement that septic systems be setback from water by 75 feet. All soils within this 75 foot setback were eliminated from the calculations.

Despite an inevitably significant margin of error, this information, combined with the group's familiarity with the LCZD, allowed for a more realistic outcome.

The data used for the analysis is available in the Lyme Select Board Office.

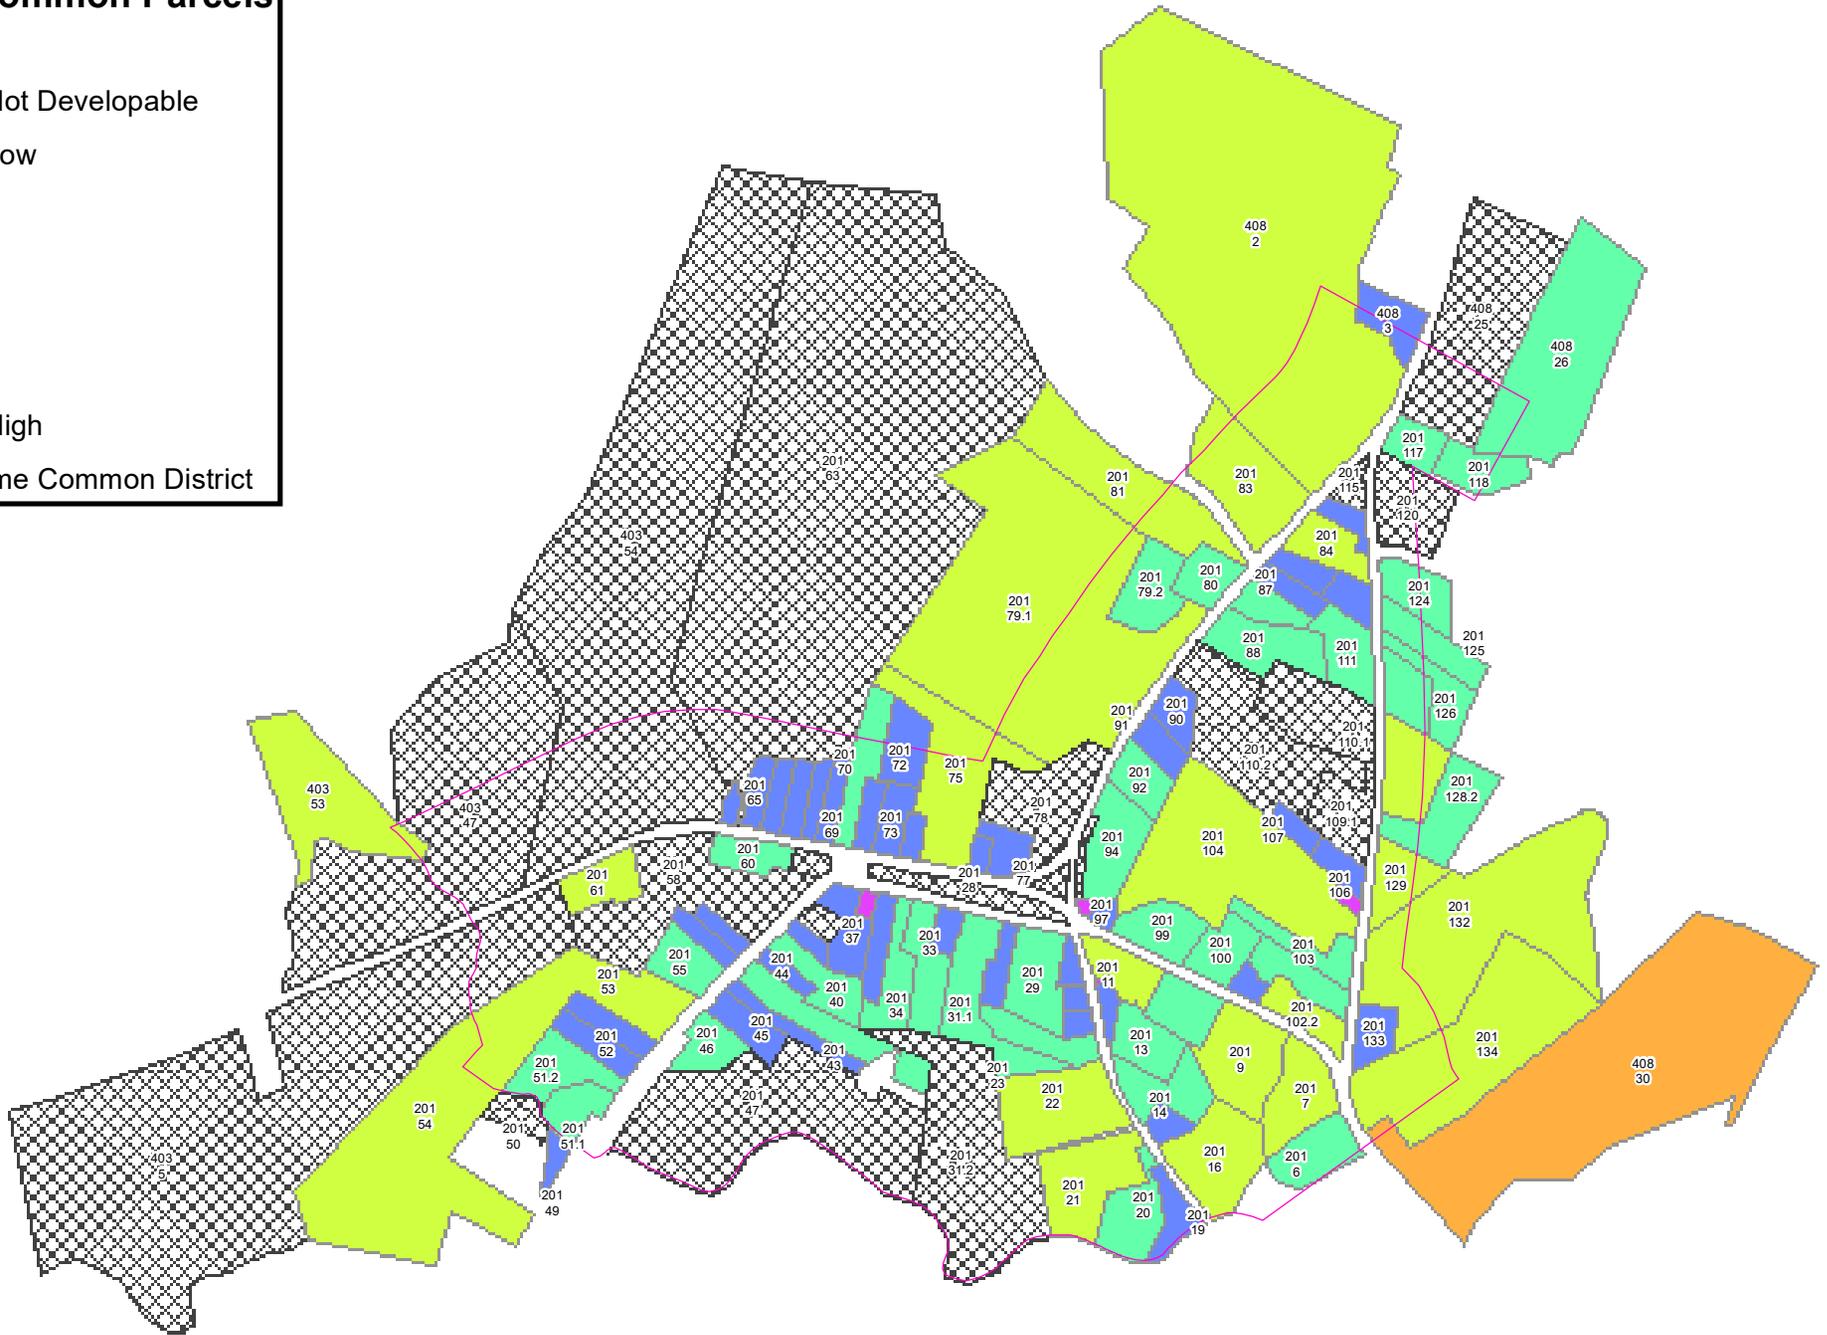

It cannot be emphasized enough that, while individual lots were looked at to facilitate this study, the takeaways are for the purposes of rough estimates as a scoping exercise only and are not legal determinations of what could be developed on any specific lot.
